

Table 3.1 Adams-Bashforth Schemes ($b = m = 0, l > 0$)	50
Table 3.2 Adams-Moulton schemes.	52
Table 3.3 List of time differencing schemes surveyed by Baer and Simons (1970). Schemes whose names begin with “E” are explicit, while those whose names begin with “I” are implicit. The numerical indices in the names are “m,” which is the number of “time intervals” over which the scheme steps, as defined in Eq. (3.3) and Fig. 3.1; and l , which controls the number of values of f used, again as defined in (3.3).	70
Table 3.4 Schemes for the nonlinear decay equation, as studied by Kalnay and Kanamitsu (1988).	77
Table 5.1 Well known methods for solving boundary value problems, and the operation count and storage requirements for each, measured in terms of, the number of equations to be solved.	136
Table 8.1 A summary of the computational boundary conditions studied by Nitta.	191
Table 8.2 Expressions for and, for Methods I, II, and III.....	208
Table 9.1 Examples of time differencing schemes obtained through various choices of q^* . The subscripts i and j are omitted for simplicity.	246
