

PRELIMINARIES

About the Cover	vi
Announcements	vii
Handy Numbers	viii
General References	xi
Preface	x

CHAPTER 1 *Introduction* **1**

The nature of the subject	1
A brief overview	3
Fasten your seatbelts	7

CHAPTER 2 *What makes it go?* **9**

The Earth's radiation budget: An "upper boundary condition" on the general circulation	9
Surface boundary conditions	16
Energy and moisture budgets of the surface and atmosphere	21
Summary	27
Problems	28

CHAPTER 3 *An overview of the observations* **29**

Introduction	29
The global distribution of atmospheric mass	32
Zonal wind	42
Meridional wind	46
Geopotential height	50
Vertical velocity and the mean meridional circulation.	54
Angular momentum	63
Temperature	69
A view in potential temperature coordinates	74
The global distribution of water vapor	80
Precipitation	85
Surface fluxes due to turbulence	89
A quick and superficial introduction to the effects of large-scale eddies on the zonally averaged flow	96
A preliminary interpretation of the observations	102

Lots of questions	108
Problems	109

CHAPTER 4	<i>Conservation of momentum and energy</i>	111
------------------	---	------------

Introduction	111
Conservation of momentum on a rotating sphere	111
Conservation of kinetic energy and potential energy	116
Conservation of thermodynamic energy	120
Conservation of total energy	122
Static energies	126
Entropy	127
Approximations	131
The mechanical energy equation in other vertical coordinate systems	132
The effects of turbulence	133
Summary	135
Problems	136

CHAPTER 5	<i>The mean meridional circulation</i>	141
------------------	---	------------

The observed meridional transports of energy and moisture	141
A simple theory of the Hadley circulation	147
Extension to other planetary atmospheres	156
Particle trajectories on the sphere: A partial explanation of “bandedness”	159
Summary	165
Problems	165

CHAPTER 6	<i>An overview of the effects of radiation and convection</i>	167
------------------	--	------------

Convective energy transports	167
Radiative-convective equilibrium	169
The observed vertical structure of the atmosphere, and the mechanisms of vertical energy transport	176
More on moist convection	184
Summary	199
Problems	199

CHAPTER 7 *The Energy Cycle* 203

Available potential energy	203
The gross static stability	209
Examples: The available potential energies of three simple systems	212
The APE associated with static instability	212
The APE associated with meridional temperature gradients	212
The APE associated with surface pressure variations	218
Variance budgets	219
Generation of available potential energy, and its conversion into kinetic energy ..	225
The governing equations for the eddy kinetic energy, zonal kinetic energy, and total kinetic energy	230
Observations of the energy cycle	233
The role of heating	236
Summary	237
Problems	237

CHAPTER 8 *Planetary-scale waves and other eddies* 241

Introduction	241
Free and forced small-amplitude oscillations of a thin spherical atmosphere	243
Perturbation equations	243
Free oscillations of the first and second kinds	247
Observations of stationary and transient eddies in middle latitudes	252
Theory of orographically forced stationary waves	260
Tropical waves	266
The response of the tropical atmosphere to stationary heat sources and sinks	275
Monsoons	282
The Walker Circulation	291
The Madden-Julian Oscillation	299
Summary	305
Problems	305

CHAPTER 9 *Wave-Mean Flow Interactions* 311

Interactions and non-interactions of gravity waves with the mean flow.	311
Vertical propagation of planetary waves	315
Vertical and meridional fluxes due to planetary waves	322
Sudden warmings	329
Eliassen-Palm Theorem-Reprise.....	330

The Eliassen-Palm theorem in isentropic coordinates	338
The quasi-biennial oscillation	346
Blocking	349
Summary	355
Problems	356

CHAPTER 10 *The general circulation as turbulence* 357

Energy and enstrophy cascades	357
Nonlinearity and scale interactions	361
Two-dimensional turbulence	362
Quasi-two-dimensional turbulence	364
Dimensional analysis of the kinetic energy spectrum	367
Observations of the kinetic energy spectrum	372
The general circulation as a blender	373
What does the blender blend?	373
Dissipating enstrophy but not kinetic energy	375
The Gent-McWilliams theory of tracer transports along isentropic surfaces	377
The limits of deterministic weather prediction	379
Quantifying the limits of predictability	385
The dynamical approach	385
The empirical approach	386
The dynamical-empirical approach	386
Climate prediction	394
The World's Simplest GCM	398
Pushing the attractors around	402
Summary	404
Problems	405

CHAPTER 11 *Tropical atmosphere-ocean interactions* 413

Introduction	413
The Walker Circulation	414
The relationship between the Walker Circulation and the sea surface temperature.	420
Theories of the Walker Circulation	422
El Niño and the Southern Oscillation	428
Sea surface temperature and thermocline slope	431
Summary	437

LIST OF FIGURES	439
LIST OF TABLES	485
REFERENCES AND BIBLIOGRAPHY	487
